

REANNZ

WHAT REANNZ HAS LEARNED ABOUT ASSESSING RISK IN THE PHYSICAL NETWORK BUILD

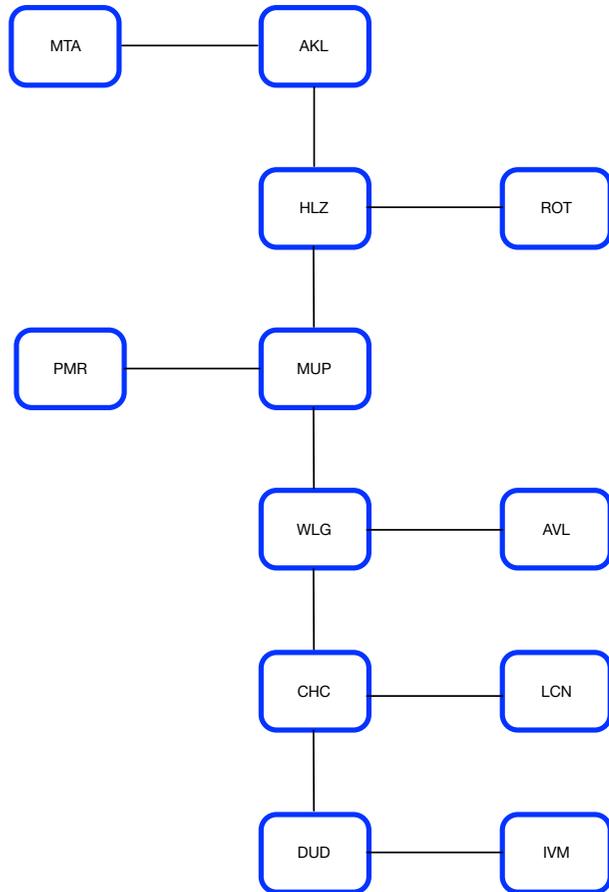

DESIGNING FOR HIGH AVAILABILITY

- Consider requirements
- Consider budget
- Avoid complexity
- Understand single points of failure
 - Connectivity
 - Power
 - Hardware

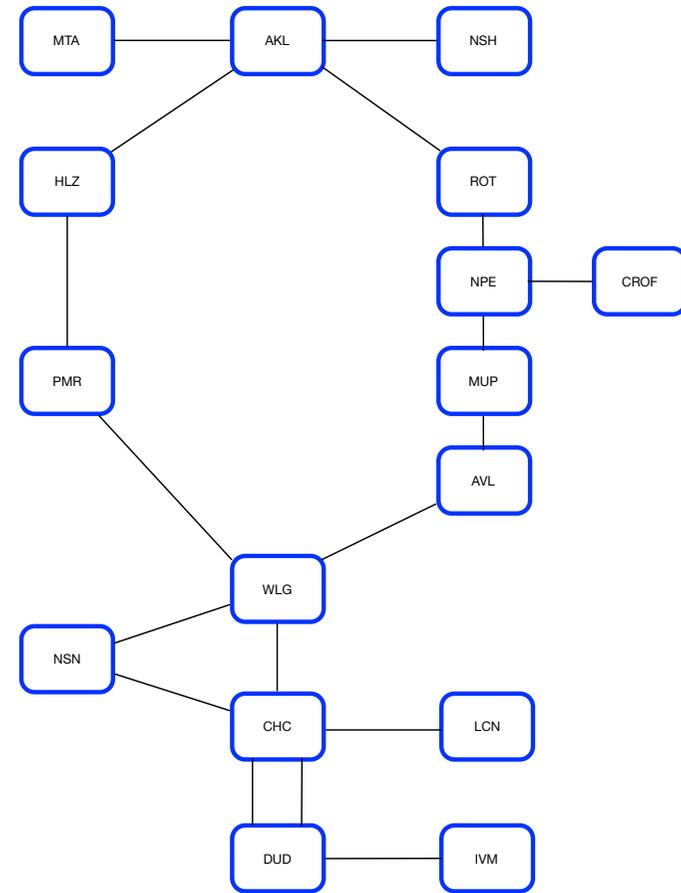

CONSIDER REQUIREMENTS

- What does high availability mean to your business?
 - 99.99% is 52 minutes 36 seconds per year
 - 99.999% is 5 minutes 15 seconds per year
 - 24x7 or 8x5?
 - Scheduled maintenance time?
- Network availability and service availability can be different

AN EXAMPLE OF REQUIREMENTS VS BUDGET

MORST RFP Design for NREN

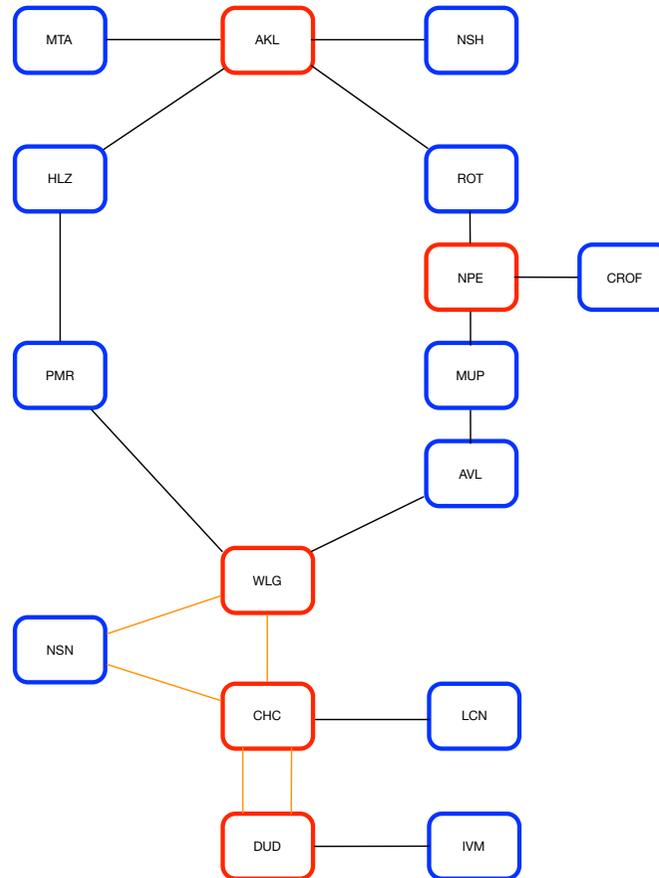

KAREN 2006

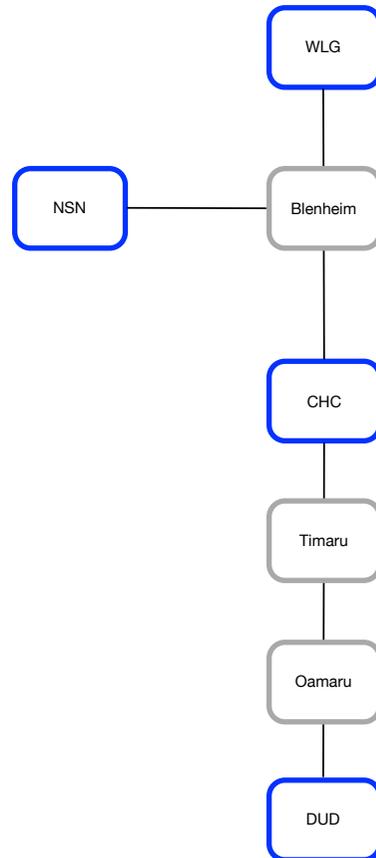

AVOID COMPLEXITY

- Chose which layer your network will be protected at
- Consider soft failures as well as hard failures
- How trusted is the technology?
- While automated failover is usually the right answer there are times where it's not achievable
- Where are spares located?

REANNZ 2006 - SOME OBVIOUS POINTS OF FAILURE & SOME NOT SO OBVIOUS

PHYSICAL INFRASTRUCTURE MATTERS WHEN ASSESSING RISK

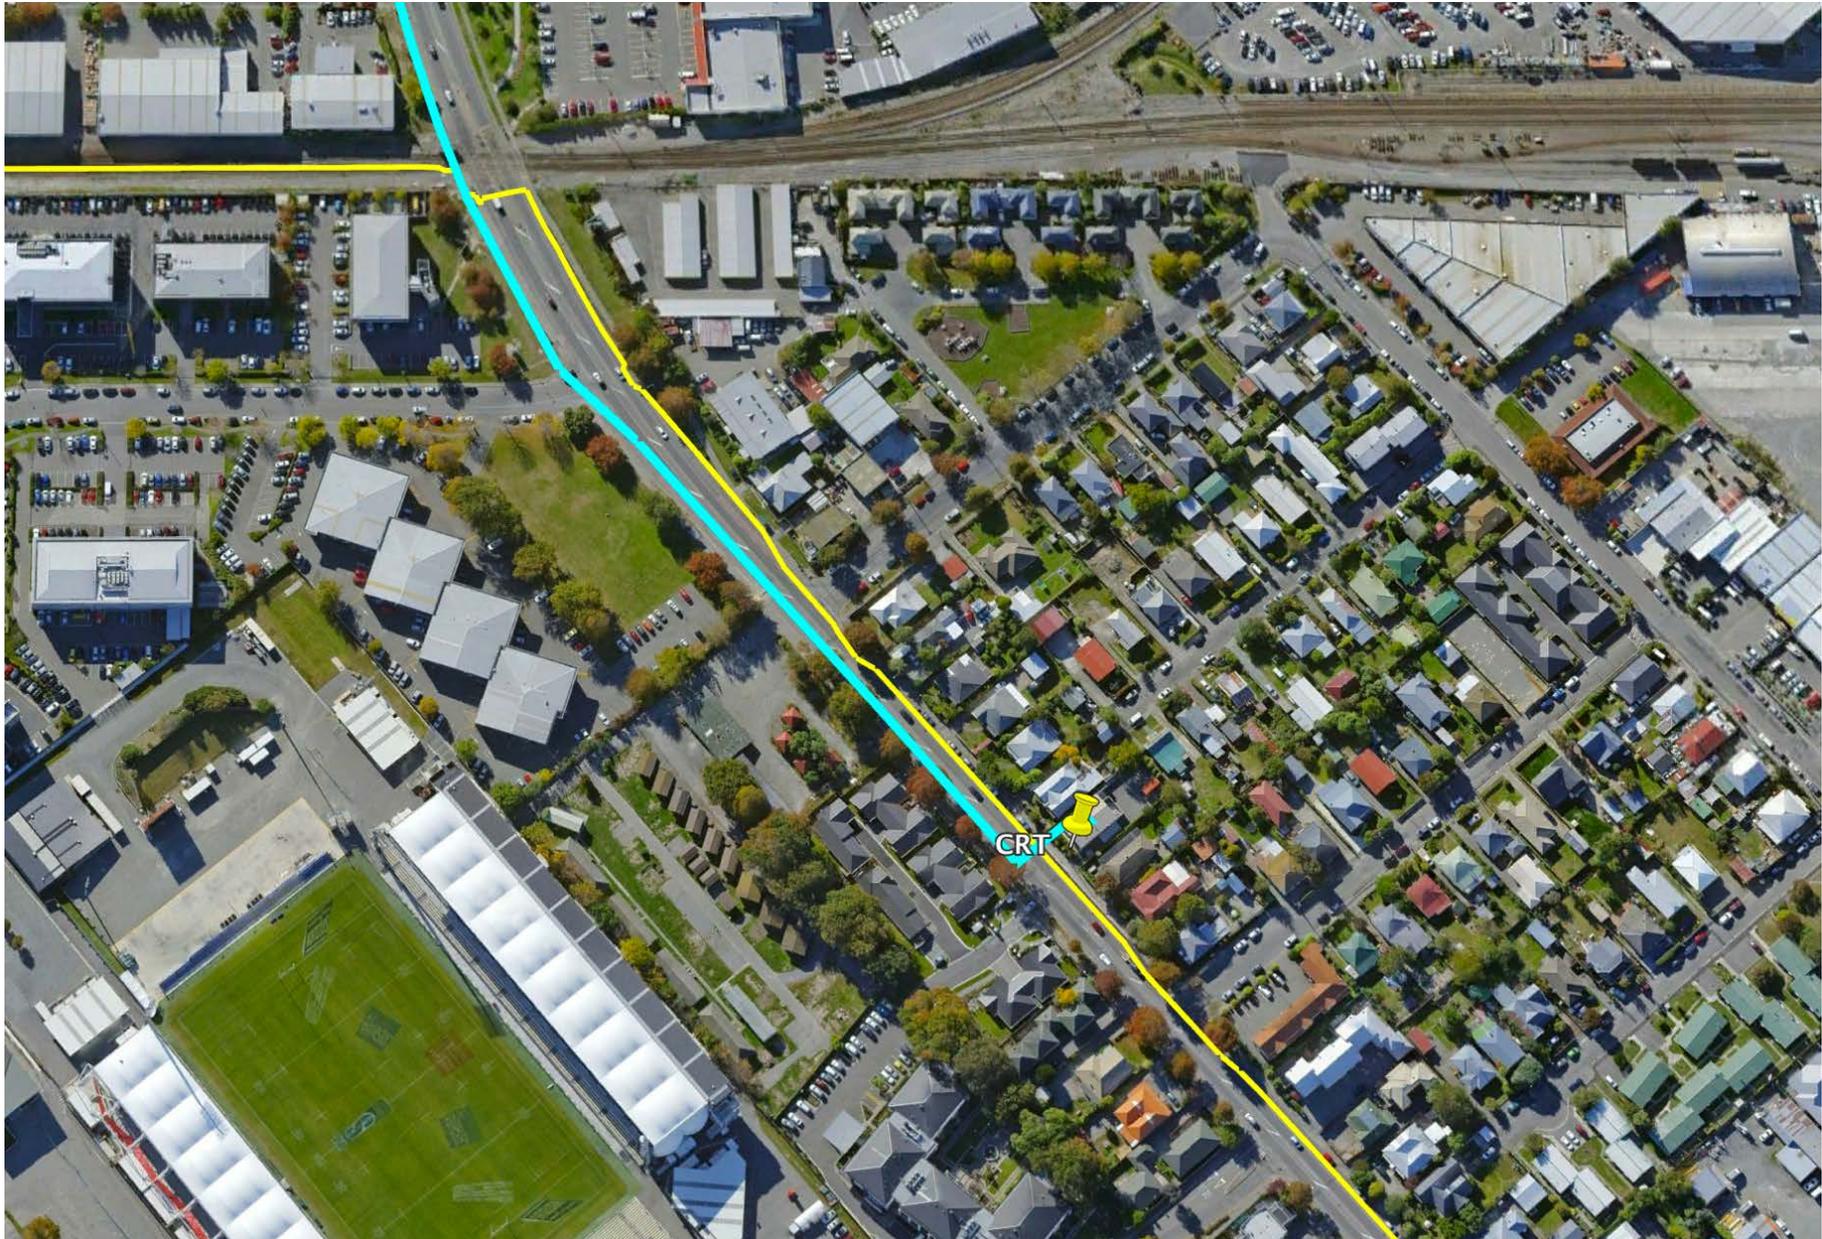

CONNECTIVITY EXAMPLES

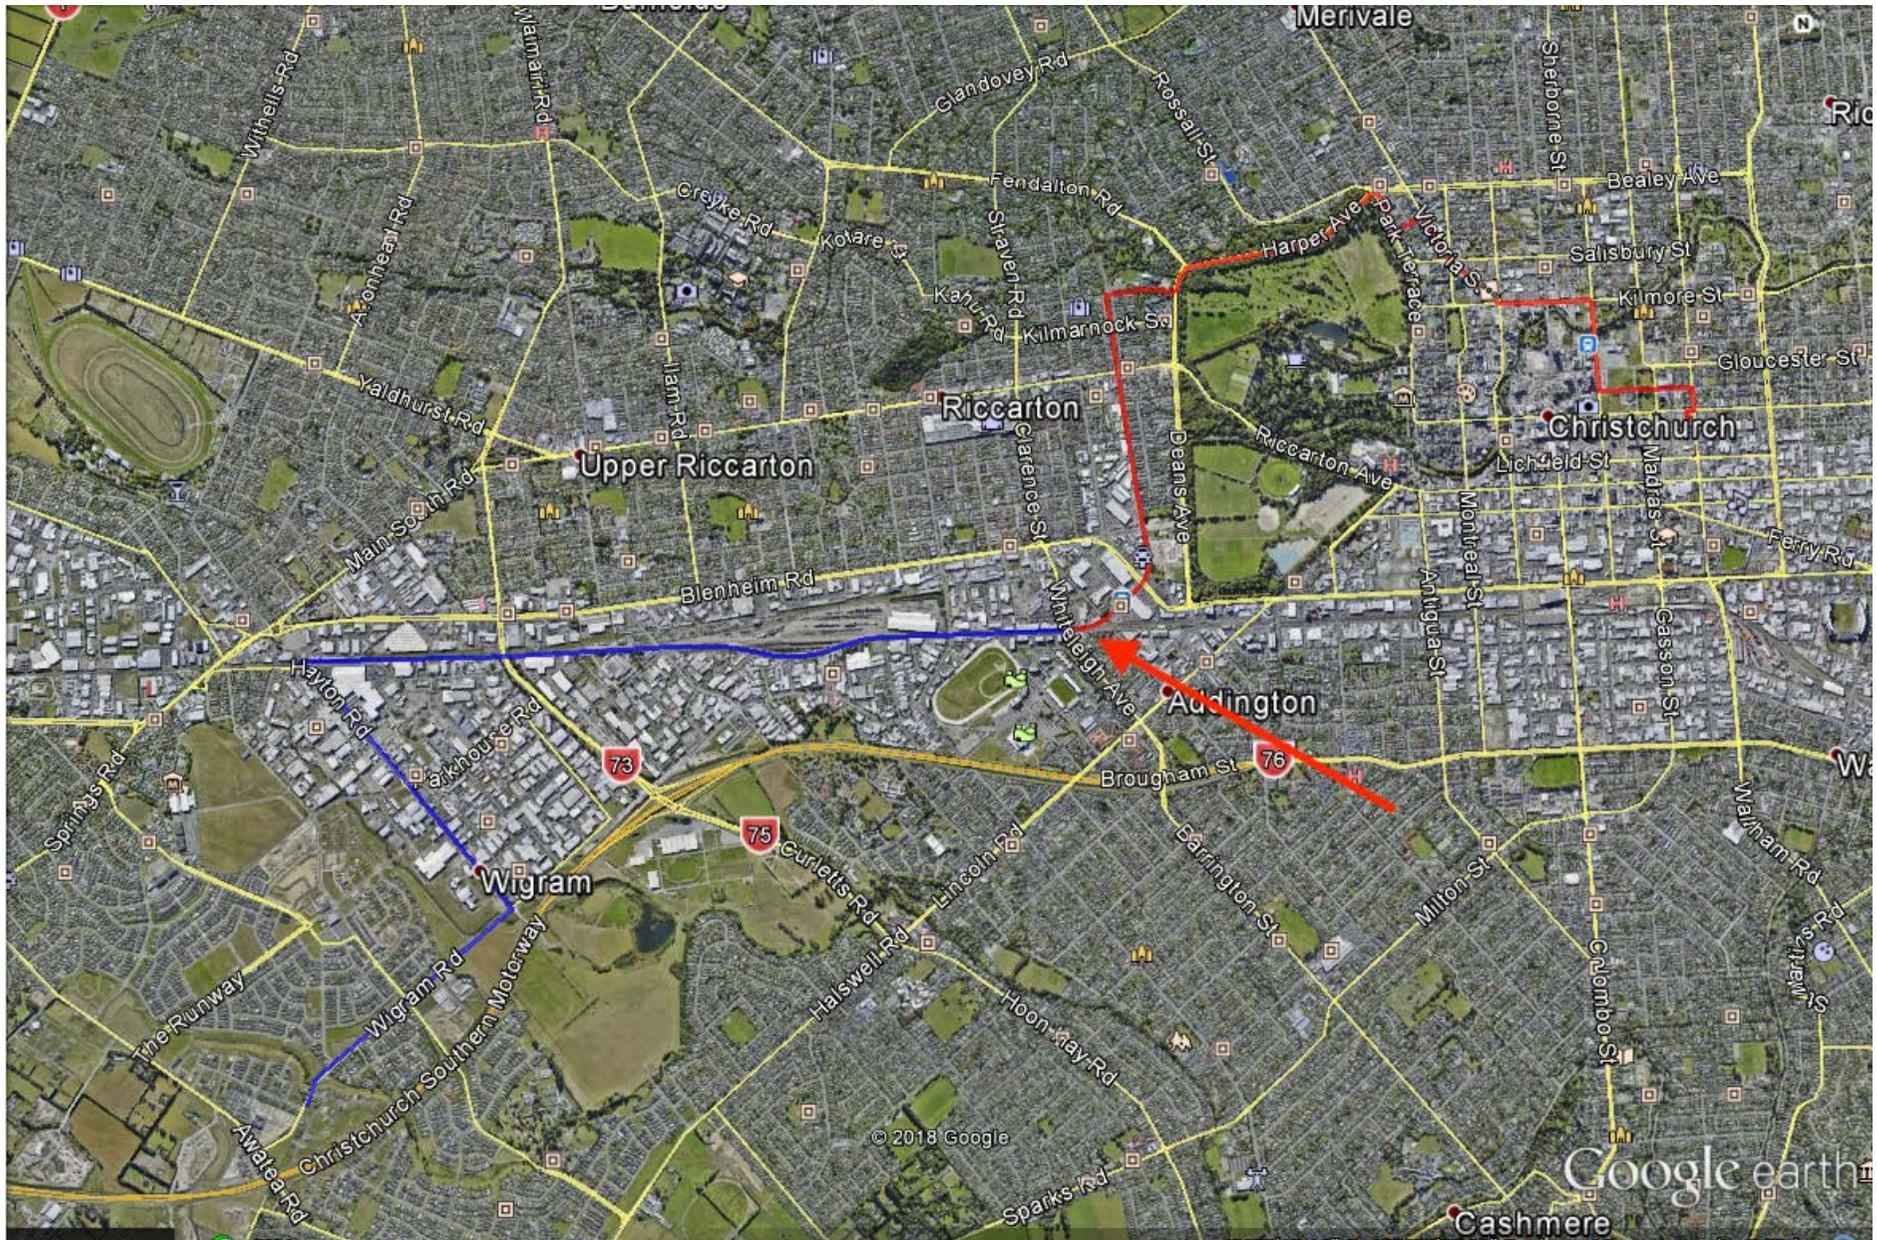

- Lincoln PoP
- Napier-Gisborne
- Cook Strait

LINCOLN POP

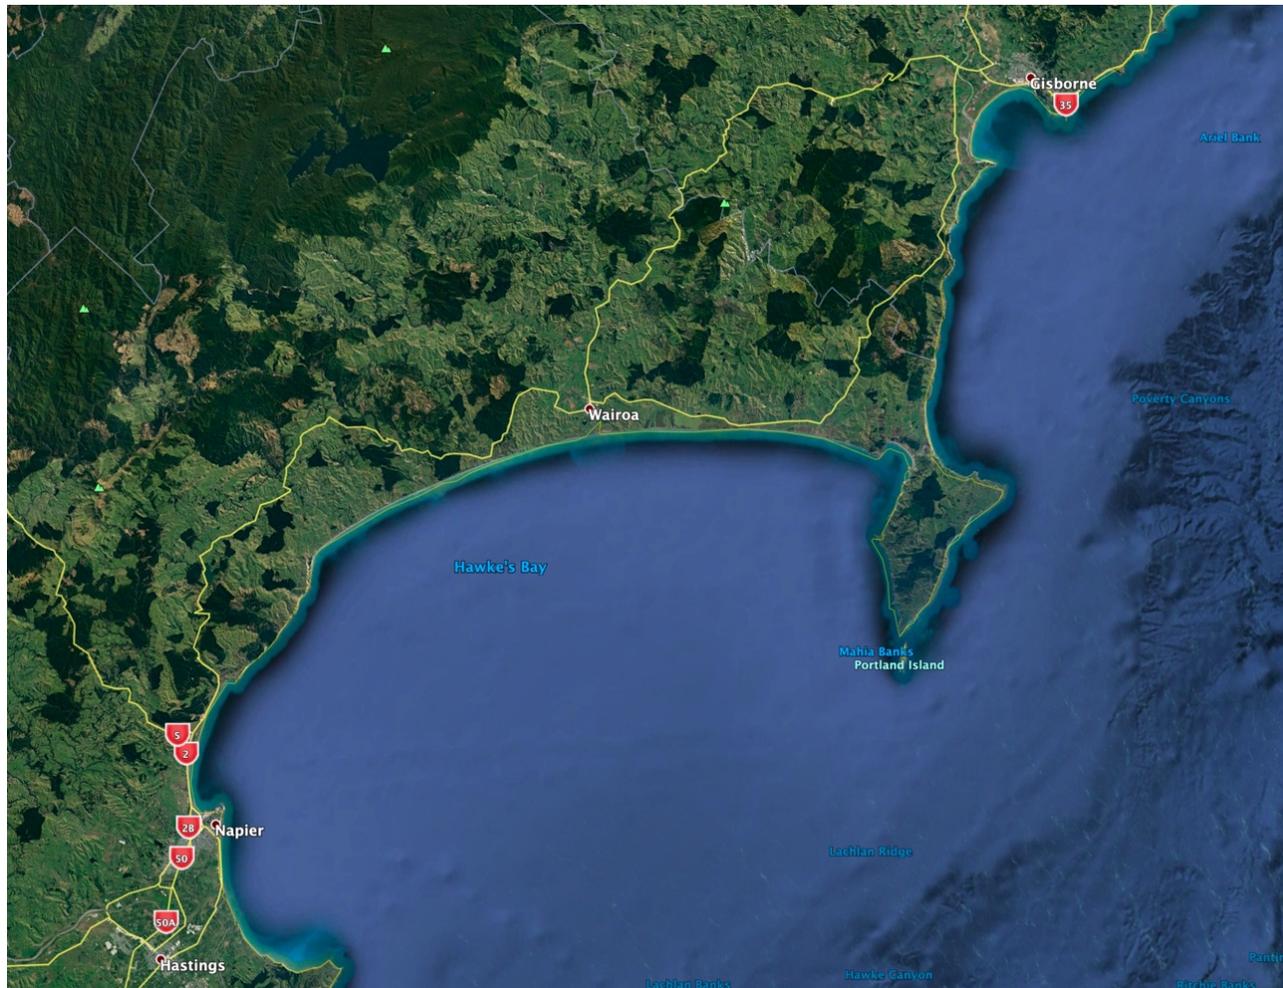

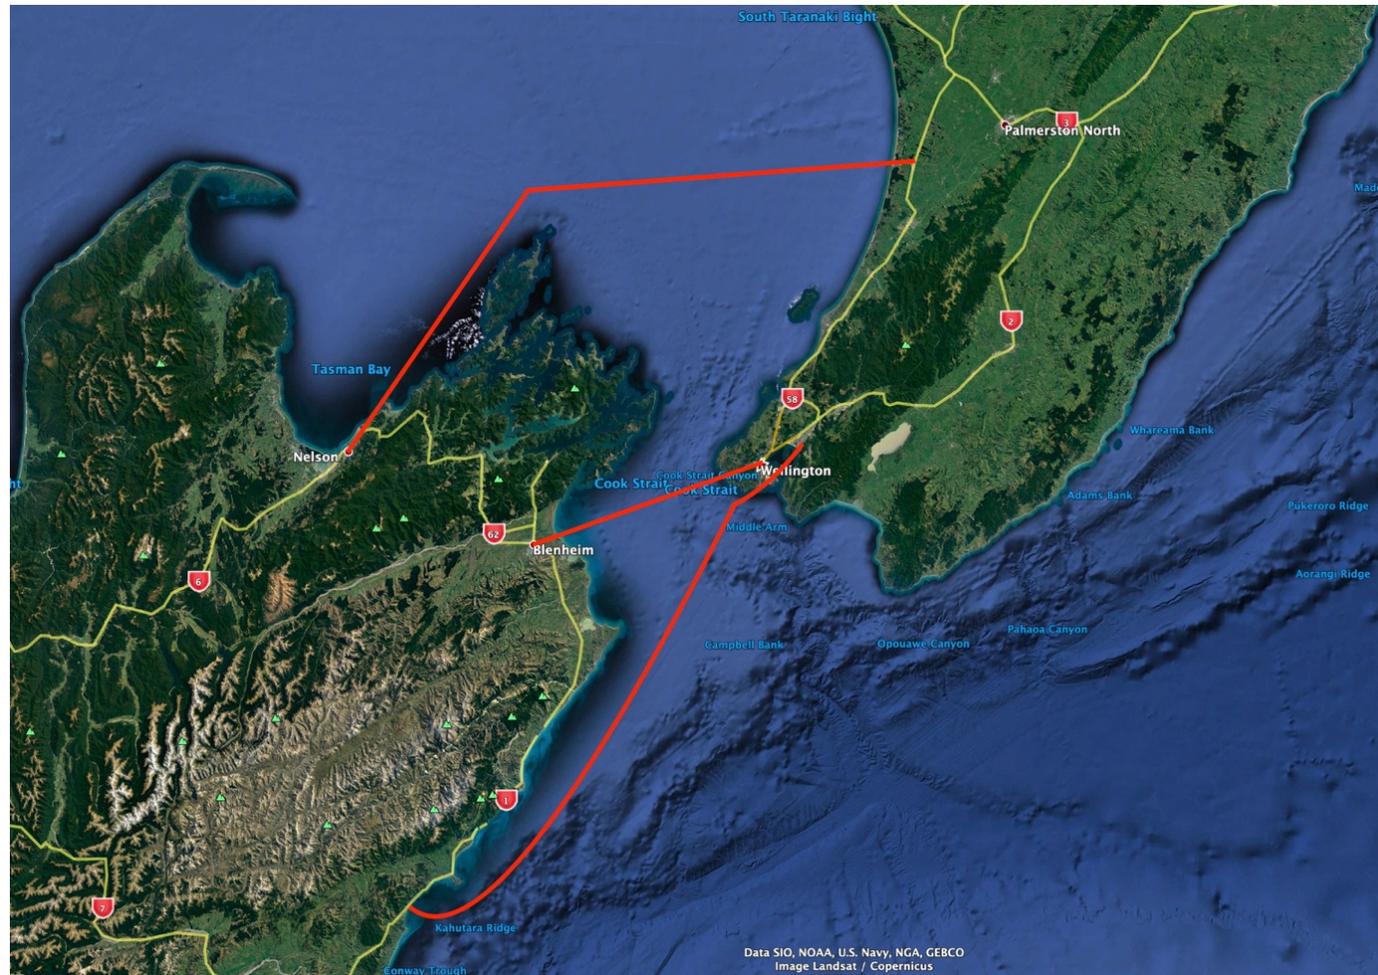

HAWKES BAY – POVERTY BAY

COOK STRAIT

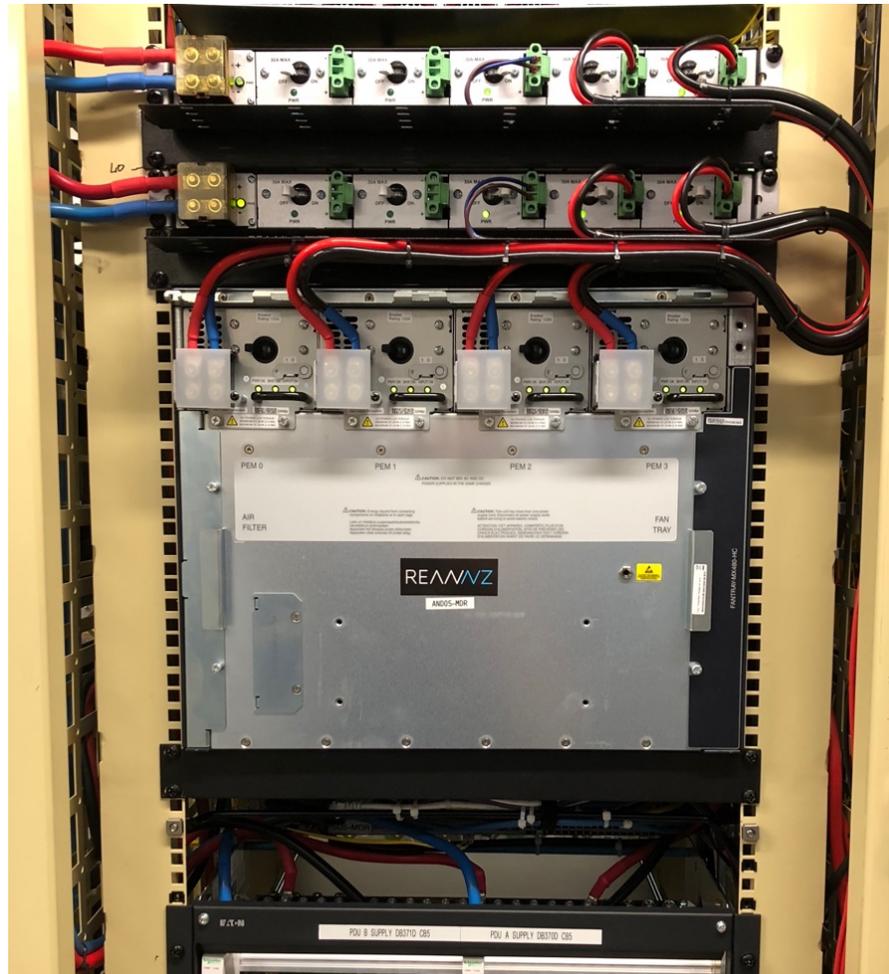

A FINAL OBSERVATION ABOUT FIBRE PATHS

REANNZ POP - POWER

- Diverse power feeds on separate infrastructure
- Backed by UPS
- Backed by Generator
- DC Power capable equipment
- Correctly identified and delivered in a way that allows for clear understanding of power usage

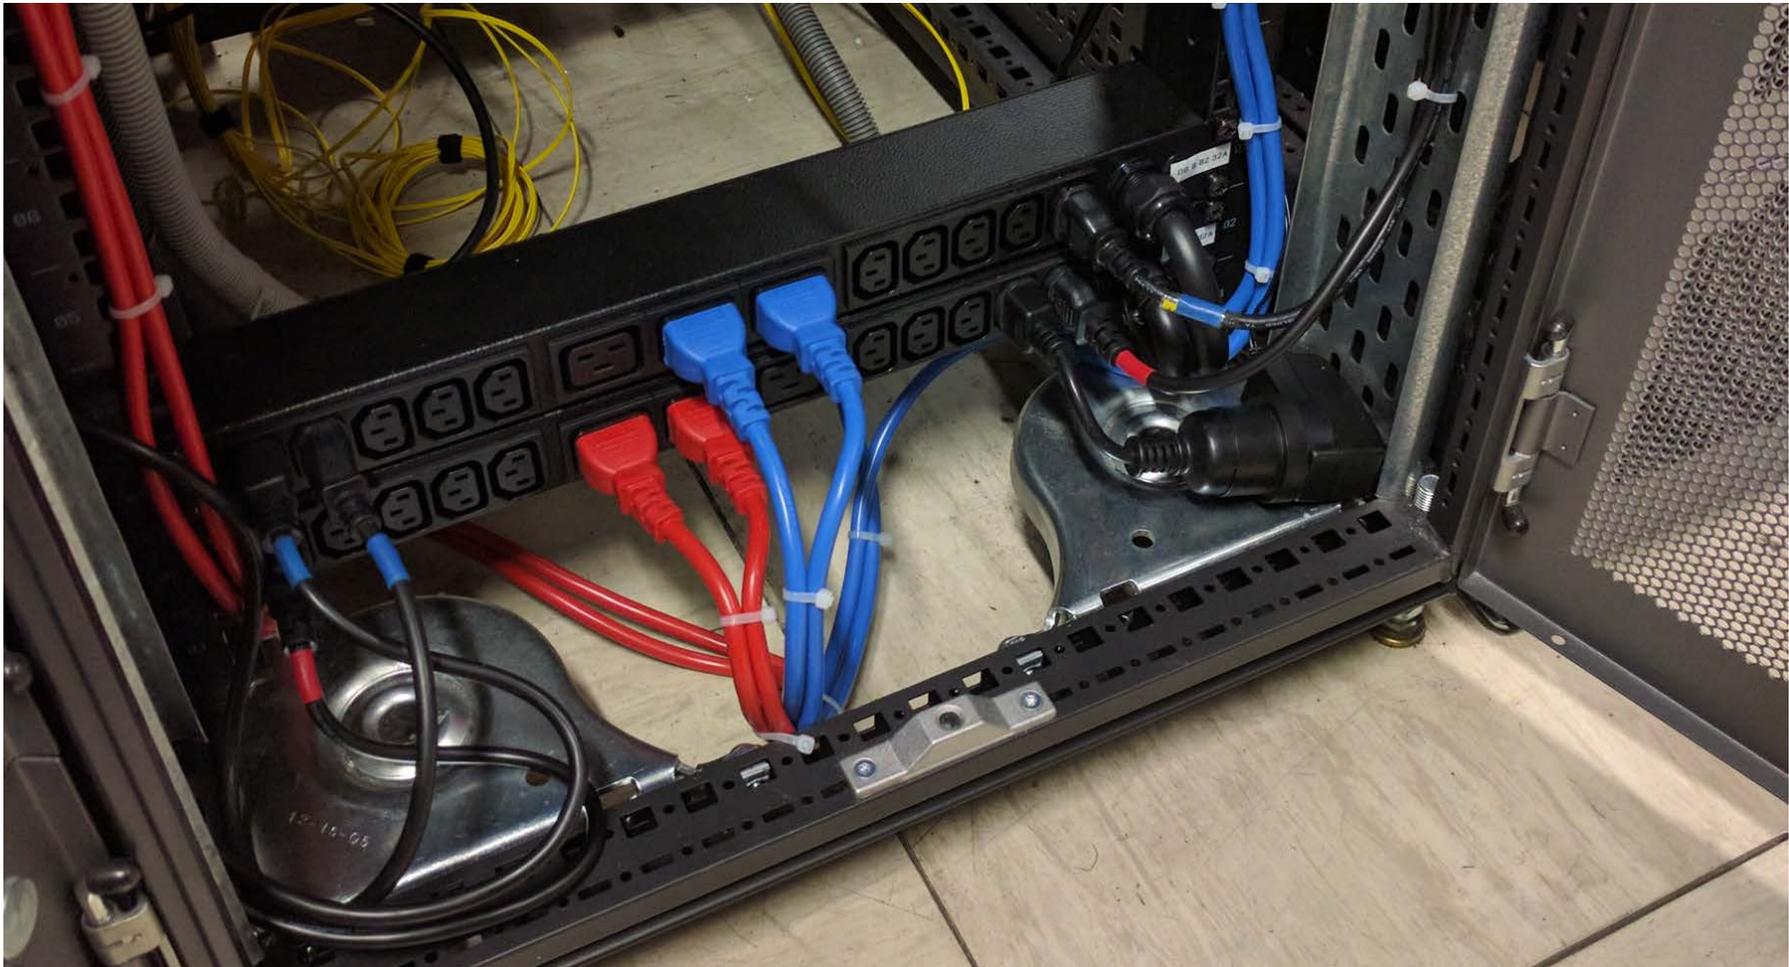

REANNZ MX480 DC SYSTEM

REANNZ MX480 AC SYSTEM

REANNZ AC CABLING

REANNZ POP - HARDWARE

- Key sites have redundant
 - Routing engines (RE's)
 - Switch fabrics (SCBE's)
 - Power modules (PEM's)
 - Line cards (FPC's)
 - Interface cards (MIC's)
- As sites get smaller the routers have fewer redundant components

REANNZ POP – MX480

REANNZ POP – MX80

REANNZ POP – MX104

WHAT CAN YOU TAKE AWAY FROM WHAT REANNZ HAS LEARNED

- Have a clear understanding of the goal
- Understand the physical infrastructure beneath any services purchased
- Understand power delivery and how your equipment consumes power
- Plan for components or systems to fail and think about how long it will take to deploy spares – test this if possible
- Understand and document your risks. Not everything can be mitigated or should be. Cost vs Risk vs Requirements.
